# Supplementary Information for Ape cultures do not require behavior copying

Alberto Acerbi, William Snyder, Claudio Tennie

#### Additional model information

This document provides additional information on the individual-based model desribed in the paper *Ape cultures do not require behavior copying*. The full code to run the model and to reproduce the results can be found in https://github.com/albertoacerbi/oranzees, together with a detailed documentation of the model development.

#### The orangees world

The oranzees model is an individual-based model, fully written in R, that reproduces a world where six populations of "oranzees" (an hypothetical ape species) live. The model is spatially-explicit: the six populations are located at relative positions analogous to the six populations of chimpanzees in Whiten et al. (1999), see Figure 1. For modelling convenience, we put these locations approximately in the centre of a  $1000 \times 1000$  squared environment in order to be able to process their relative distances, that we use to calculate genetic propensity and ecological availability of the behaviours (see below).

The population sizes are also taken from the real chimpanzees populations considered in the study above. Following Lind and Lindenfors (2010), we use data from R. W. Wrangham (2000):

| Group      | Population size |
|------------|-----------------|
| Uossob     | 20              |
| Elabik     | 42              |
| Ognodub    | 49              |
| Iat Forest | 76              |
| Ebmog      | 50              |
| Elaham     | 95              |
|            |                 |

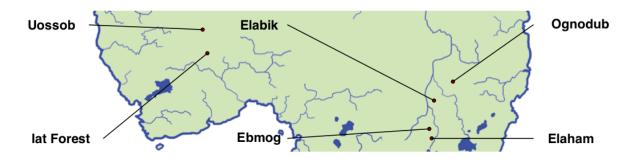

Figure 1: Location of the six populations of orangees.

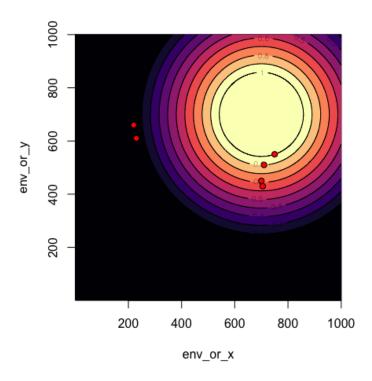

Figure 2: Example of calculation of  $p_g$  (or  $p_e$ ). The red points represent the orange populations. The color gradient represents the value of  $p_g$  (or  $p_e$ ).

#### Geographical gradient for genetic propensity and ecological availability

As described in the main manuscript, two parameter of the models,  $\alpha_g$  and  $\alpha_e$ , determine the probability that the genetic propensity and ecological availability associated to the behaviors are equal for all the six populations, or if they differ among the populations.

Independently for each behaviour, if genetic propensity (or ecological availabilty) is equal, the probability associated ( $p_g$  or  $p_e$ ) is a randomly drawn number between 0 and 1, the same for all six populations. If they are not equal, the values of  $p_g$  (or  $p_e$ ) are assigned using a geographical gradient, by choosing a random point in the oranzees' world, and calculating its distance to each population. Distances are then transformed to  $p_g$  (or  $p_e$ ) by rescaling them between 0 and 1, so that for the farther population  $p_g = 0$  i.e. the associated behaviour will be impossible to express (or  $p_e = 0$  i.e. the associated behaviour will be absent with an "ecological explanation").

In the example in Figure 2, a particular behavior will have  $p_g = 1$  (or  $p_e = 1$ ) in the Ognodub site,  $p_g = 0$  (or  $p_e = 0$ ) in Iat Forest and Uossob, and intermediate values in the other sites.

## Sub-categories of behaviours

There are 64 behaviours are possible in the model (inspired by the 65 coded in Whiten et al. (1999)), divided in two main categories: "social" and "food-related". Each category is further subdivided in sub-categories. Sub-categories, for food-related behaviour, are further assigned to specific "nutrients". These information are used to calculate oranzees' state according to its behaviour (see main manuscript). The names of behaviours and of the sub-categories are only suggestive. They are used to illustrate our results in Figure 2 (main manuscript).

#### Social

| -            |                     |  |
|--------------|---------------------|--|
| Sub-category | Behavior            |  |
| Play         | fruit-missile       |  |
| Play         | slap-fight          |  |
| Play         | air-split           |  |
| Play         | leaf-mask           |  |
| Play         | whistle             |  |
| Play         | pebble-tease        |  |
| Play         | tumbling            |  |
| Play         | brick-fall          |  |
| Display      | stone drop          |  |
| Display      | branch pull-release |  |
| Display      | arm-cross           |  |
| Display      | two-hand-drum       |  |
| Display      | splash              |  |
| Display      | arm-swing           |  |
| Display      | explode-leaf        |  |
| Display      | contorsionist       |  |
| Groom        | tool back-scratcher |  |
| Groom        | hand back-scratcher |  |
| Groom        | tongue-bathe        |  |
| Groom        | tooth-pick          |  |
| Groom        | dirt-shower         |  |
| Groom        | ant-shower          |  |
| Groom        | q-tip               |  |
| Groom        | exfoliate-fruit     |  |
| Courthsip    | flower-offer        |  |
| Courthsip    | hand-stand          |  |
| Courthsip    | rope-swing          |  |
| Courthsip    | leaf-fan            |  |
| Courthsip    | wreath-clutch       |  |
| Courthsip    | ear-pull            |  |
| Courthsip    | kissy-hand          |  |
| Courthsip    | hop-dance           |  |

## Food-related

| Sub-category          | Behavior               | Nutrient     |
|-----------------------|------------------------|--------------|
| Fruit-hammer foraging | wood-wood              | Y            |
| Fruit-hammer foraging | wood-stone             | Y            |
| Fruit-hammer foraging | stone-wood             | Y            |
| Fruit-hammer foraging | stone-stone            | Y            |
| Fruit-hammer foraging | bone-wood              | Y            |
| Fruit-hammer foraging | bone-stone             | Y            |
| Fruit-hammer foraging | wood-ground            | Y            |
| Fruit-hammer foraging | stone-ground           | Y            |
| Stick-based foraging  | stick-throw V          | $\mathbf{Z}$ |
| Stick-based foraging  | stick-throw A          | $\mathbf{Z}$ |
| Stick-based foraging  | fish-stab              | $\mathbf{Z}$ |
| Stick-based foraging  | hedgehog-flick         | $\mathbf{Z}$ |
| Stick-based foraging  | worm-hook              | $\mathbf{Z}$ |
| Stick-based foraging  | bird-probe             | $\mathbf{Z}$ |
| Stick-based foraging  | fish-hammer            | $\mathbf{Z}$ |
| Stick-based foraging  | spin-seed              | $\mathbf{Z}$ |
| Anvil smash           | anvil-smash S          | Y            |
| Anvil smash           | anvil-smash W          | Y            |
| Anvil smash           | smash-ground           | Y            |
| Anvil smash           | drop-ground            | Y            |
| Rolling pin tecniques | rolling-wood           | $\mathbf{Z}$ |
| Rolling pin tecniques | rolling-stone          | $\mathbf{Z}$ |
| Rolling pin tecniques | rolling-bone           | $\mathbf{Z}$ |
| Rolling pin tecniques | rolling-other          | $\mathbf{Z}$ |
| Insect swatting       | bug-clap               | Y            |
| Insect swatting       | stick-insect           | Y            |
| Fish stunning         | fish-stun-stone        | Z            |
| Fish stunning         | fish-stun-wood         | $\mathbf{Z}$ |
| Tortoise-flip         | tortoise-drop-on-stone | Y            |
| Potato-mash           | tube-mash              | $\mathbf{Z}$ |
| Clubbing              | mammal-clubbing        | Y            |
| Egg cracking          | egg-crack              | Z            |

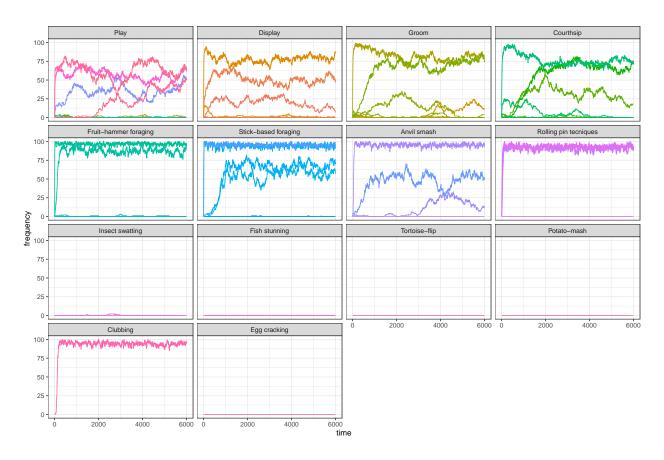

Figure 3: Example of a single run with  $\alpha_g = 0.2$ ,  $\alpha_e = 0.8$ , and S = 1. The plots show the frequencies of the 64 possivble behaviors, divided in panles by sub-category.

#### Example of single run

Figure 3 shows an example of the entire history of all behaviors in a single run, for a single population (geographical location and population size are based on "Uossob"), with  $\alpha_g = 0.2$ ,  $\alpha_e = 0.8$ , and S = 1, i.e. one of the combination of parameters that produces a number of cultural behaviour similar to Whiten et al. (1999).

#### Age classes to calcualte customary behaviours

To determine *customary* behaviours, we need to define age classes for individuals (the definition of customary behaviours, from Whiten et al. (1999) is a behaviour observed in over 50% of individuals in at least one age class). We define three age classes as follows:

- adults: individuals that are more than 16-year old.
- $\bullet \;\; subadults:$  individuals between 8 and 16-year old.
- juveniles: individuals that are less than 8-year old.

# Supplementary figures

## Figure S4

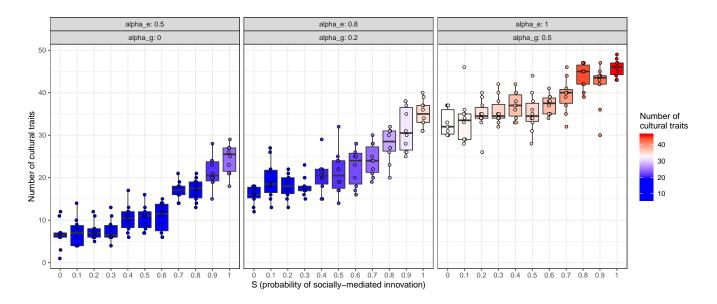

Figure 4: Cultural traits in oranzees, varying the probability of socially-mediated innovations. Red colour indicates simulation runs that produced more than 38 cultural behaviours; blue colour indicates simulation runs that produces less than 38 cultural behaviours. S,  $\alpha_e$  and  $\alpha_g$  as indicated in the plot. N=10 runs for each parameters combination.

# Figure S5

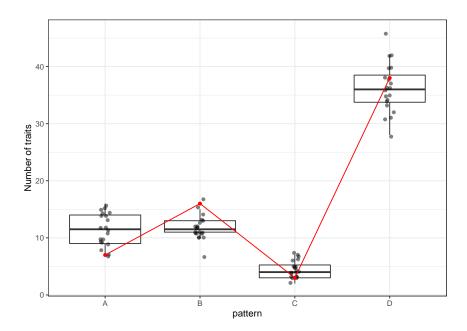

Figure 5: Number of behaviours for each of the four patterns (\*A\*, \*B\*, \*C\*, \*D\*) for the parameters  $\alpha_e = 0.8$ ;  $\alpha_g = 0.2$ , S = 1. The red values are the values described for real chimpanzees populations. N = 20 runs.

# Figure S6

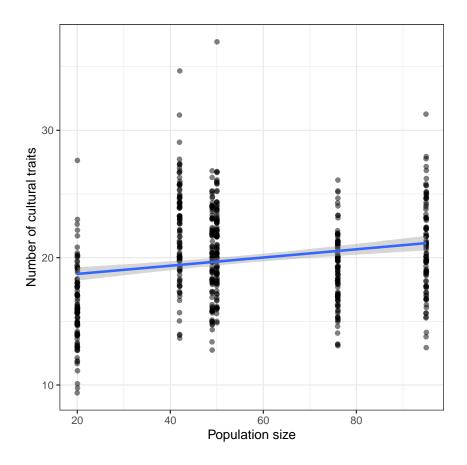

Figure 6: Number of cultural behaviours for each population for the parameters  $\alpha_e = 0.8$ ;  $\alpha_g = 0.2$ , S = 1. The blue line is a linear fit of the data. N = 100 runs.
